DNA Nation May 16 2021 Millions of people have done it: with a few clicks and some spit, and at less than the cost of a fancy dinner, you can buy a reading of your DNA online. With this in hand, you can find out where you came from, trace relatives around the world and find new friends on a genetic social network. You can learn about your predisposition to disease, get a genetically tailored diet, understand the sports to which you or your children might be more suited, and even find a date. It's the dawn of consumer genomics, where the progress of biology meets the power of the Internet and big data. But do these applications work? Can we really prevent diseases based on what we read in our DNA? What do scientists say? And do we really understand the implications? What happens if things go wrong and the data is misused or the trust abused? Sergio Pistoï, a journalist and a DNA scientist, investigated this brave new world first-hand by interrogating his own genes, and has provided a practical, informative and thought-provoking survival guide to home genetic testing. From medicine to food, from social networking to genealogy and advertising, this book will show you how the DNA revolution is beginning to have such a profound impact on our daily lives and privacy and why it will influence the choices we make. If you are interested in how social media meets cutting-edge science, and what it means for your life, or if you are considering buying a DNA test, then this is the book for you.

To Your Health Mar 02 2020 The public is bombarded daily with reports about risk factors, many conflicting with each other, others accepted as "scientific truth" for awhile, then scientifically disproved, yet others questionable that later prove to be true. Physicians are faced with trying to make sense of those conflicting or questionable results in the scientific literature in order to guide their patients to the best possible decisions. The situation is not much easier for scientists who may waste years of their productive life, and considerable resources, basing their research efforts on what prove to be misleading earlier research findings. What this book does is to present, in non "academese" and with many examples from the general media and scientific journals, a guide to a critical reading of research reports, which, in turn, serves as a guide to researchers as to which approaches are likely to be regarded with raised eyebrows, and what they need to do to generate results that will be taken seriously. This stimulating and helpful book was written for informed consumers and physicians as well as for scientists evaluating the risk research literature or contemplating projects on risk research.
